Final Presentation & Report

- team presentation on Wednesday 26th April @ 2.45pm
- team report due on Wednesday 3rd May by 5.15pm

Final Assessment Outline

- final design of game from DEV Week...
 - continue to develop your group's game concept
- working game (as close as possible)
- explain choices made in the design and development
 - initial choices
 - final implementation choices, options, patterns...
- show and explain implemented differences from DEV Week
 - where and why did you update the game?
 - how did playtesting influence your updates and designs?
 - perceived benefits of the updates?
- how did you respond to feedback from DEV Week and onwards...
- anything else you consider relevant to your game
 - within reason...

n.b. 10 minutes maximum per group (11 groups in total)

Final Assessment Report

report outline - demo and report

Project Status Report

- what is currently working?
 - what is currently playable?
- what is left to add or fix?
 - features, characters, challenges &c.
- who is working on what?
 - logic, design, testing, research...
- any special requirements for demo and presentation?

Teams

- Group I Team Additup
- Group 2 Team Addventure
- Group 3 Team Adventure-LN
- Group 4 Team Burman
- Group 5 Team Cicale
- Group 6 Team DBU
- Group 7 Team Global Citizen Duo
- Group 8 Team Golfing Trio
- Group 9 Team Horror
- Group 10 Team Plastico Sibaq
- Group II Team Prestianni

Game designers

Designer example - Rob Pardo

- Pardo is best known as the lead designer of Blizzard's
 World of Warcraft
- various jobs and titles at Blizzard, including
 - lead designer and Executive Vice President of Game Design
 - before becoming Chief Creative Officer until the middle of 2014
- his best known games include, for example,
 - World of Warcraft
 - WarCraft
 - StarCraft now free to download
 - Diablo
 - Mortal Kombat
- Pardo was instrumental in pushing a different concept for WarCraft
 - more towards what we now consider traditional RPG games...
- with the introduction of 3D for WarCraft III
 - they tested various options for camera usage in this type of game
- after experimenting with different angles and perspectives
 - including a lower shooting position
 - they settled on the now familiar, traditional isometric view
- assessment of camera options became a key factor in this game's development
 - informing many of the early 3D prototypes for this game
- prototyping also allowed Pardo and his design team

- to iteratively determine the nature of units and heroes in the game
- such concepts and designs helped shape the nature of the game
 - its story, possible objectives, characters, units...
 - e.g. the development of WarCraft's races

check initial functionality

- eventually you'll need to allow testers and players to actually play the game
- there may be rough edges to your game
 - perhaps even broken code in places
 - but you should be working towards a functional game...
- e.g. some form of a test version of your game
 - that allows an unfamiliar player to experience and play your game
- a lack of guidance and prior knowledge of the game's design and development
 - often helps in this determination of functionality
- test players should be able to interact with your game
 - interact without your influence or interference
 - might include paper prototypes or an early example of the digital game itself
- how do we determine if a game is functional?
 - often a matter of subjective judgement
- a useful heuristic to determine a functional game
 - consider if a test player can complete a session without a developer's guidance and advice
- after determining the functional nature of a game
 - begin a consideration of a game's functionality compared to completeness
- even if a game is functional, there will still be aspects that are incomplete

- including unintended loopholes, dead ends, glitches...
- some may be useful, others popular with test players &c.

check completeness

- test every aspect of a game to ensure completeness
- checking for incomplete parts of our game
- might include issues with a game's logic, rendering, performance...
 - or a result of poorly defined rules and procedures
- for an identified incomplete game section
 - initially begin by considering the defined rules for the game
- checking the game's design document and prescribed rules
 - ensure there are no mistakes, contradictions, or gaping holes in the conceptual logic
- after fixing an identified issue
 - also need to check for any knock-on effects with other parts of our game
- need a few testing sessions and checks
 - helps ensure completeness has been initially considered and resolved
 - often becomes a rolling series of checks, updates, and re-testing
- also determine issues as play testers become involved in the process
 - detect issues that are not necessarily a result of ambiguous rules
 - perhaps a result of unintentional gaming options
- well-known example of this unintentional feature or issue is the spawn camping problem. e.g.
 - Camping in Games
 - seen in FPS games, such as Call of Duty and Rainbow Six Siege

• not unique to FPS...

check for unintentional features

- another consideration on our way to a game's completeness
 - the hunt for unintentional features in gameplay and features
- looking for a flaw in our game
 - a player may exploit for an unfair or unwarranted advantage
- player manipulation of a game is crucial to the experience
 - in essence to simply win a game
- unintentional features often occur to the detriment of the game itself
 - often ruins the sense of play in the game
 - may prejudice one player over another in certain environments
- game may not be considered complete whilst such issues persist
- many players enjoy tracking and recording such unintentional features
 - may become a fun aspect of the gaming experience
- well-known example arose in the game Deus Ex
 - originally released in 2000
- Deus Ex includes an explosive weapon, a grenade
 - a player could attach this weapon to a wall
 - then use them as a make-shift ladder to climb walls
 - also able to climb to unintended places on the game's map
- as a result, certain levels became considerably easier

 less challenging and interesting than originally intended

Video - Gaming Issues

Deus Ex climbing

unintentional vs intentional features

- unintentional issues may pose problems for game designers
 - they may also become intentional features to many players
- quirks and perceived issues may still become a benefit
- perceived as an asset to the underlying gameplay
- again, consider the spawn camping problem
 - many examples online of gamers who like this type of game feature
 - e.g. many Rainbow Six Siege players are in favour of this feature
- consider MMORPGs and role of players
 - often such games do not include a clearly defined ending
 - create a sense of community
 - foster a long term social setting for players.
- for MMORPGs, many players dislike killing in the game
 - malicious killing of other players discouraged
 - such player killers seen as detrimental to fun, harmony, enjoyment...
- developers continue to modify such online worlds to discourage player killers
 - various options in games such as Asheron's Call, EverQuest, Ultima Online...

Asheron's Call

- in Asheron's Call, which finally finished on 31st January 2017
 - designers originally created a system of allegiance and fellowship
 - new players were given the chance to swear allegiance to another player
 - might receive protection, money, weapons &c. in the game
 - this relationship became bi-directional with each player gaining...
- further mods introduced to Asheron's Call
 - e.g. prevented a player from directly attacking another playe
 - also modified the underlying story for this game
 - provided players with a share of magic and protection of Dereth
- some players founds this too limiting they missed being player killers
 - they saw the game as overly boring, lacking in challenge &c.
- further modification was added by the developers
 - allowed players to voluntarily convert to player killer status
- happy medium achieved in this game for many players
 - through testing and feedback
 - by default, players were free from the threat of being killed
 - player killers could engage each other
- a great social community grew up around this game
 - until its servers were finally closed down earlier this year

Video - Gaming Issues

Last moments of Asheron's Call

Games and development

quick exercise

Choose at least one of the following games,

- Asheron's Call
- Asteroids
- Deus Ex
- Journey
- Mario Kart

or use your own game idea and concept.

Then consider the following questions:

- as a designer and developer, which aspects of the game would you leave open to change during testing?
- how do you integrate these changes into your game before publication?
- what is the minimum you consider necessary for this game to be functionally complete?
 - in effect, ready for initial testers and players?
- can you identify unintentional features and issues that might arise from knowledge of similar games?

a dead end

- another type of flaw or issue that may occur in our game
 - a perceived dead end in gameplay, functionality...
- a noticeable difference when compared with unintentional features
 - do not allow players to gain an advantage or possible exploit in the game
- a dead end is something we need to fix as quickly as possible
- developers of adventure games commonly encounter this issue
 - Zork a bench mark example
 - many such as Sierra's King's Quest, Space Quest...
- for some players, dead ends have become a nostalgic recollection
 - they became a part of the expected gameplay for original adventure titles
- we may start to consider a game as complete and functional
 - internally complete
 - player can operate a game without compromising gameplay or functionality
 - considered an objective and subjective question
 - game is not complete room for improvement
 - lingering issues, flaws, dead ends...

Video - Complete and Functional

Dead End Dancer in King's Quest

concept of balance

- balance is a concept in game design that is regularly mentioned
 - but often misunderstood or poorly applied...
- a common underlying issue with this concept of balance for game design
 - we may abstract this concept
 - but it still needs to be applied in specific cases...each and every time
- to begin balancing the design and development of a game
 - begin by ensuring that it meets the specified player experience goals
- we're checking the breadth and scope of such goals
 - i.e. have they been met relative to the game's complexity?
- also checking for any unnecessary or undefined results
- such checks and balances may also be influenced by the players themselves
 - e.g. single player versus multi-player options
- for multi-player options, we may need to ensure
 - a game's resources, gameplay, and goals are even as the play begins
- for single player options, we may simply consider
 - a balance between a player's skill level and the game's challenge
- issues of balance can become problematic for designers and developers
 - consider requirements of such goals relative to our own preferences, desires...

- very nature of trying to balance many divergent elements within a complex system
 - has potential to create many headaches for designers and developers

Game designers

Designer example - Rob Pardo on design and balance

- recurrent use of iterative design for each game title and series at Blizzard
 - key aspects of game design for Pardo...
- iterative modification of game variables
 - a key factor to the success of their designs
 - helps strike a balance in the way the game performs and plays
- this process continued for their titles right up to the initial release
 - new spells in WarCraft III just before public release
- holes and options still remain open in public beta
 - allows suggestions from testers, pro gamers to be integrated
- testing and iterative design continues long after a game's initial release
 - StarCraft testing and development continued for 2 years after release
- this included perceived imbalances in the game
 - patches or updates &c. to reflect loopholes and glitches
- any of these issues were discovered and shared by the gamers
 - then required updates to re-balance the game
- Pardo was also proactive in creating a new role at Blizzard
 - for analysing and monitoring online player behaviour and usage
- this so-called game balance designer
 - might check statistics and patterns recorded for a given game

•	then start to test adjustments for applicable part of the game

symmetry

- initially, symmetry in gaming is a simple concept
- give each player the same resources and conditions as they game begins
 - along with information about the story, gameplay &c.
 - a game should be symmetrical...
- classical examples of initial symmetry include draughts, chess...
 - many turn-based examples include initial symmetry
- symmetry is a particularly useful concept
 - we may modify as necessary to create interesting and fun games
- a few changes here and there to such perceptions of symmetry
 - the nature of a game may be easily changed and updated
- for symmetrical games such as draughts...
 - still the potential for loss of symmetry
 - e.g. who gets to move first?
 - such a game may become asymmetrical quickly
- may negate any perceived advantage of moving first
 - e.g. chess limits first move to a pawn or knight
- such moves are rarely game changing
 - potential still remains for challenge for an expert player
- a similar option to maintain and persist symmetry
 - we may introduce a concept for chance elements in a game

- benefit of reducing the potential for one player to dominate gameplay
 - may reduce unintentional effects of starting first in a symmetrical game
- chance elements may include, e.g.
 - random options, scaled variants, emergent systems...
- trying to ensure there is reduced potential for biased gameplay

asymmetry

- we may also offer our players asymmetry, e.g.
 - varying attributes, abilities, resources...
- also vary a game's rules, and its underlying objectives
 - to fit different players' roles and requirements
 - game has switched to become asymmetrical in nature
- a perceived fundamental characteristic of such asymmetry in games
 - need to maintain a balance of fair gameplay for each player
- racing games, such as Mario Kart, are great examples
 - e.g. variant attributes, skills, and perfomance for each kart and character
 - creates balance for a player relative to skill levels and experience
- each player should still retain the potential to win the game
 - regardless of the variant, asymmetrical factors...
- asymmetry becomes a useful option for us as designers and developers
 - e.g. creating games that model behaviour, stories, and gameplay on real life examples
 - such examples will commonly be asymmetrical
- vast majority of video games are asymmetrical
 - e.g. RTS games such as Command & Conquer

create a balance

- for most games we create and complete
 - aiming for a balance between challenge and player's skill level
- naturally vary from player to player
 - for most instances we're clearly aiming at a middle ground
 - creating a median skill level
- already seen examples of classes in **Diablo**
 - different players may assume varied roles in this game
- consideration of player skill levels in Civilization
 - uses varied levels of difficulty
 - includes certain defaults for properties and values
 - e.g. cash reserves vary from chieftain to emperor
- Civilization uses varying skill levels
 - helps to customise properties and attributes in the game
- balancing a game for median skill level requires extensive testing
- testing each game to see where the balance lies for such properties and attributes
 - customary to start with more experienced, hard-core players
 - start at perceived highest skill level
 - helps set high mark for the game's skill levels
 - then test and set beginner, lowest skill level
- use high and low boundaries for skill levels
 - becomes easier to test varied properties and attributes

- keep testing until median is established and set
- skill levels need to be considered relative to a game's varied stages
 - customary to incrementally increase difficulty
 - whilst reducing difference between skill levels for players
 - scale for skill levels starts to shrink...

balance options

- possible to consider balance in a game as a constituent part of the underlying logic
- as a game progresses, we may establish certain conditions
 - to allow the game to incrementally modify player skill levels
 - adapt a game to match a player's skill level
 - e.g. as they improve and advance through various challenges modify game
- examples include Tetris, Gran Turismo, Mario Kart...
 - Tetris modifies speed of block falling to match a player skill level
 - speed becomes a coefficient of difficulty and challenge
- racing games show subtle modifications to such skill levels and perceived difficulty
 - Mario Kart introduces a semblance of self-balancing to the racing system
 - helps create a fair sense of challenge relative a player's skill level
 - a proportional representation between speed and skill for the player and the computer
 - e.g. as a player gets faster, computer controlled cars will speed up
 - if a player crashes or slows dowm, other cars may slow down
 - ensures there is some gameplay left for a particular level or track...
- balancing creates a sense of challenge
 - whilst maintaing a semblance of fun and achievement...

modular options for balance

- to help us develop a balanced game consider various parts that constitute the game itself
 - sub-components that combine to form the game
 - rare to design a game as a single, monolithic unit
- we can start to consider balance in smaller units
 - customarily relate to smaller, inter-related subsystems
 - subsystems that coalesce to form our game
- we may consider our game as a series of discrete functional units
- by clearly defining each unit
 - helps us identify its functionality and requirements
 - its relations to other units in the game
- consider a common RPG (role-playing) game as a group of subsystems
 - e.g. as combat, movement, resources...
- each subsystem forms a part of the overall game system
 - may also present obvious issues as we try to balance the system
 - e.g. one module or subsystem that is interconnected with another
 - changes to one may precipitate an unexpected cascade in another
- we may start by isolating each subsystem
 - abstracting their usage and implementation from the whole
- testing and configuring each subsystem
 - trying to ensure functional independence from the overall game

- crucial for developing a large scale game...
- we're following many standard practices for object-oriented programming
- by clearly defining the I/O for each functional unit
 - able to more effectively analyse and monitor each unit
 - i.e. as we balance and maintain the overall game system

balance and focus

- balance may also be derived from a clearly defined sense of purpose
- a game's focus and goals helps set clear requirements and parameters for I/O
 - whilst helping to define the modular components for the development
- identification of purpose helps assign a clear usage and structure
 - to a game's development of underlying modular components
- consider why you have certain components in your game system
 - what is a component's purpose?
 - is this purpose unique to the component?
 - will the game work without this component?
 - ...
- a component's purpose needs to be
 - clear, well-defined, and logical
 - suitable for the type of game being developed
- each component in a game should have a purpose
 - where possible no component should have more than one primary function
- e.g. start by considering a game's mechanics
 - how to dissect them into fundamental parts for the game's requirements
 - what is the purpose of such mechanics?

- by clearly defining such constituent parts we're trying to avoid
 - a development scenario with a mix of rules and subsystems
 - a mess of tangled rules, ideas, options &c.
 - e.g. different conflicting ideas, concepts &c.
- if we then need to modify an aspect of the mechanics
 - perhaps update or remove an element
 - we only need to modify one aspect of the gameplay
- balancing a game's mechanics, and gameplay by association
 - becomes more systematic and methodical rather than trial and error
- this pattern of balance and focus also helps promote
 - incremental development, modification, and testing

Games - Systems and Fun

choices

- fun balanced against a game's sense of challenge or conflict
 - helps provide required hooks in a game
 - often simply emotional attachment to a game
- strive to captivate players
 - helps promote a sense of connection and interest in a game's outcome
- Sid Meier famously noted,

Games are a series of interesting choices (decisions)...

- often derided as overly simplistic
 - still a semblance of truth to this sentiment...
- as a player progresses through a game, they are constantly making choices
 - some big, others small
 - together they help a player make sense of the gaming world
- as game designers and developers
 - strive to provide a sense of consequence and meaning to these choices
- real world experiences also help shape our perception of such choices
- if there is little sense of consequence or feedback to a choice or decision
 - we start to question its validity and merit
- such examples start to become a distraction

- definitely something we want to avoid in most games
- start by trying to inform a player
 - an awareness of potential consequences of decisions and actions
- e.g. consider introducing a simple dilemma that challenges the player
 - helps them consider certain choices more carefully
- calculation of a choice relative to its potential outcome
 - useful way to challenge our players throughout a game
- often subtle in nature
 - it's still a useful option for maintaining interest in gameplay

Games and development

quick exercise

Choose at least one of the following games,

- Asheron's Call
- Asteroids
- Deus Ex
- Journey
- Mario Kart

or use your own game idea and concept.

Then consider the following questions:

- what are the various opportunities for challenge and play present in your chosen game?
- what are examples of individual challenges in this game?
- are there any repeating challenges or dilemmas in this game?
- how do these choices or challenges help create a sense of fun in the game?
 - and, as a consequence, act as a hook for the player

Games - Systems and Fun

considering choice

- adding choice to a game will often improve competition, challenge...
 - may also present a hook for our players
- adding choice to general gameplay without the potential for consequence
 - may simply remove any chance of player engagement
- to increase the potential for this player engagement
 - choice should present opportunity to change or modify a game's direction
- each choice should present the player with a possibility
 - a positive or negative outcome
 - e.g. to advance player to the end of the game...
- this becomes the common risk and reward strategy
- Meier's comment on interesting choices or decisions
 - encapsulated this concept of a series of choices
 - choices that flowed throughout a game
- in contrast to decision making in books and movies
 - a player may interactively experience such choices for themselves
- need to ensure that we provide the right game environment
 - one that permits such choices and decisions by the player
- start by simply deciding types of player decisions
 - e.g. decisions a player must make in a particular game

 perhaps based on puzzles, motor kills, perception 					

Games - Systems and Fun

meaningful decisions

- regardless of the choices offered in a game
 - need to ensure decisions are meaningful and relevant
- focus initially on the main objective of the game
 - then structure your game to help your player achieve this end goal
- review your game and its choices
 - check for minor or tangential decisions
 - if present, revise game and choices
- may need to reconsider these decisions and choices
 - so that they matter to the context of the game
- a balance should also be struck between the types of choices offered
 - with the simple intention of creating balance in your game
 - e.g. recurring action based choices may get tiresome and annoying
- consider the narrative structure with its abyss and summit
 - acts as a good indication of variation in story and gameplay
- decisions and choices may often follow a similar pattern

Video - Meaningful Decisions
